### [3] Waste (WS)

Recycling of organic waste at the university is important for several reasons:

**-Environmental responsibility.** The university, as an educational institution, should be an example for society in the field of environmental responsibility and sustainable development. Recycling helps to reduce the amount of garbage sent to landfills and reduce the negative impact on the environment.

**-Economic benefit.** Recycling of organic waste can lead to the creation of new jobs and the development of local enterprises. This contributes to economic growth and improved quality of life in the region.

**-The educational aspect.** Students and teachers can participate in the waste recycling process, which contributes to their environmental education and the formation of a responsible attitude towards the environment.

**-Cost reduction.** Recycling of some types of organic waste (for example, food) may be more economically profitable than their disposal or burial.

**-Infrastructure improvement.** The creation of an infrastructure for the processing of organic waste requires investments in equipment and technology, which can stimulate the development of relevant industries and increase the level of innovation.

In general, the processing of organic waste is an important aspect of the university's activities, contributing to its sustainable development and improving environmental culture among students and staff.

### [3.4] Total volume of organic waste treated

Type of waste	amount (ton)				
	Total	reduced	reused	down-cycled	up-cycled
organic	880	127	154		
- food waste	450	55	110		
- leaf, etc.	300	60	35		
- etc	130	12	9		

#### **Description:**

In recent years, the university has been actively working to solve the problem of recycling organic waste. Significant progress has been made in this area:

- A laboratory has been established to study and develop new methods of processing organic waste, which has already conducted several successful studies.
- The University has entered into partnership agreements with several enterprises and organizations involved in waste recycling, which allowed the introduction of new technologies and methods into production.
- The University provides training courses and seminars on ecology, waste management, and recycling for students and specialists.
- The university staff participates in research projects and grant programs aimed at developing new technologies and methods of waste recycling.

-The university has created an infrastructure for the processing of organic waste: special containers for separate garbage collection have been installed, as well as equipment for its further processing has been purchased.

The University continues to work in this direction, striving to contribute to solving environmental problems and creating a more sustainable future.
